- Pelotas Platform and Basin Assessment Unit 60370101
- Pelotas Basin Geologic Province 6037

**USGS PROVINCE:** Pelotas Basin (6037)

**GEOLOGIST:** C.J. Schenk

**TOTAL PETROLEUM SYSTEM:** Cenomanian-Turonian-Tertiary Composite (603701)

**ASSESSMENT UNIT:** Pelotas Platform and Basin (60370101)

**DESCRIPTION:** This assessment unit encompasses much of the Pelotas Basin from the Florianopolis Arch in the north to the Polonio Arch in the south, and from about the 100 m to 3600 m water depths. Included is the area of the Rio Grande Cone.

**SOURCE ROCKS:** Source rocks are postulated to be mudstones of the Cenomanian-Turonian interval, and possibly Early Tertiary mudstones.

**MATURATION:** Timing of maturation is postulated to have occurred in the deeper parts of the basin in mid-Tertiary time based on thickness of section on seismic lines.

**MIGRATION:** Migration is postulated to be local, from bottomset mudstones into adjacent lowstand sandstones of all types. However, thermogenic gas may be migrating vertically throughout a large part of the basin. Listric faults may be common in the Rio Grande Cone, and may serve as migration pathways.

**RESERVOIR ROCKS:** Reservoirs are postulated to be lowstand fan sandstones, slope-channel sandstones, shelf-edge deltaic sandstones, and lowstand shoreline sandstones, similar to the Cretaceous-Tertiary Brookian clastic section of the Alaskan North Slope.

**TRAPS AND SEALS:** Traps are postulated to be largely stratigraphic traps in lowstand sandstones. Traps related to listric faults may be present in the area of the Rio Grande Cone. Seals are considered to be mainly intraformational mudstones.
